

3D Website Designing Prompts (Guide)

Overview

This document provides a comprehensive guide for designing a premium interactive product website. It details instructions for generating highly realistic images and exploded engineering views of a product. The guide also outlines the exact steps and timings for an animation where the product smoothly separates into its individual parts and then reassembles. Finally it offers a complete blueprint for building a scroll driven landing page using modern web tools, covering the visual design, text placement, and technical requirements needed to create a high quality user experience.

OpenAI Academy

THE ECONOMIC TIMES

About Us

Cutting Edge School enables enterprises to adopt AI with precision and clarity. We build structured AI programs for teams, customers, and partners. Our focus is on helping organisations integrate AI into daily operations, accelerate adoption, and create long-term capability inside the business.

We have delivered practical AI and automation training for leading enterprises across India and the UAE, including **Intel, HP, The Economic Times, Dubai Future Foundation, Dubai Holdings, Lenskart, Reliance Digital, myTrident, DCM Shriram, Apeejay Surrendra Group and Lloyds Metals.**

Our global educational footprint includes:

1. **650,000+** YouTube subscribers focused on applied AI and automation.
2. **300,000+** followers across social platforms engaging with AI education content.

For more information, visit: www.cuttingedge.school

First frame

Use the uploaded image as the primary and only reference. Recreate the exact same **[product]** with maximum fidelity and realism. Preserve the original design with perfect identical **shape, structure, proportions, surface finish, color palette, patterns, branding, labels, typography, logos, and all design elements** exactly as shown in the reference image. Do not redesign, reinterpret, alter, or stylize anything — stay 100% true to the uploaded reference. Enhance image quality only: ultra-sharp details, clean edges, accurate text rendering, realistic **[material]** surface with correct texture and finish, subtle natural reflections, soft professional studio lighting from multiple angles. Photorealistic product photography, pure white seamless background, premium commercial quality, 8K resolution, highly detailed, cinematic lighting, zero distortion, true-to-life color accuracy.

Last frame

Exploded layer-separated engineering view of the same **[product]** with a **[primary material & finish]**, every layer precisely separated and floating in perfect alignment, suspended mid-air within soft white/grey studio fog and cloud haze. Show the product opening into clean layers: **[layer 1], [layer 2], [layer 3], [layer 4], [layer 5], [layer 6], [layer 7], [layer 8]** — all centred, evenly spaced, perfectly aligned on a single vertical axis. Lighting: soft diffused studio illumination with gentle rim highlights, controlled reflections on **[material finishes]**. Editorial engineering aesthetic, ultra-sharp focus, photorealistic, ultra-high resolution. No labels, no annotations, no text.

Transition

Photorealistic 3D product animation of a **[product]**. Opens on a fully assembled **[product]** in hero position — perfect studio lighting, soft white seamless background, gentle ambient occlusion. Camera holds for 2 seconds in a slow cinematic orbit. Then, with surgical precision, the product begins a **slow-motion professional disassembly sequence** — each component separates smoothly along its own axis, no snapping, no jumping, zero frame glitches. Every part floats outward with **eased motion curves (ease-in-out cubic bezier)**, maintaining perfect spatial alignment throughout the entire transition. Components separate in logical disassembly order: **[outermost layer → innermost layer]**. Each part moves at a slightly different speed creating a natural cascading stagger effect. Mid-transition, a brief pause at 50% separation — then continues to full exploded state. Final frame: all layers perfectly centered, evenly spaced, floating in soft white-gray studio fog. **Zero motion blur artifacts, zero layer clipping, zero**

pop-in, zero flickering. Frame-perfect interpolation between every state. Apple-style product keynote aesthetic — restrained, precise, premium. Cinematic 24fps, ultra-high resolution, photorealistic materials throughout. No labels, no text, no UI overlays.

Phase 1 → Hero Hold [0s – 2s] Assembled product, slow orbit
Phase 2 → Initiation [2s – 3s] Micro vibration, parts breathe apart
Phase 3 → Disassembly [3s – 7s] Slow staggered layer separation
Phase 4 → Mid Pause [7s – 8s] 50% exploded, dramatic hold
Phase 5 → Full Explosion [8s – 11s] All layers reach final positions
Phase 6 → Final Hold [11s – 14s] Full exploded view, slow camera drift

Universal Premium Scrollytelling Landing Page Prompt

****you need to change product name and details about that product according to your likings.**

ACT AS: A world-class creative developer and brand experience director specializing in ultra-premium web design, advanced scroll-based storytelling, and cinematic product interactions for global tech and consumer brands.

THE TASK

Design and implement a high-end, Apple-level scrollytelling landing page for the **[detailed product name]**.

The experience is a cinematic product reveal combined with an interactive engineering showcase. The core mechanic: as the user scrolls, a **scroll-linked image sequence** plays —

the headphones disassemble into a floating technical diagram, then gracefully reassemble — all synchronised with storytelling beats and premium copywriting.

Image frames are pre-loaded from the project's image sequence folder and rendered on a full-screen HTML5 Canvas. No external sequence assets are needed.

TECH STACK

- **Framework:** Next.js 14 (App Router)
- **Styling:** Tailwind CSS
- **Animation:** Framer Motion (scroll-linked, eased transitions)
- **Rendering:** HTML5 Canvas for image-sequence playback (hardware-accelerated, no flicker)
- **Fonts:** Inter via Google Fonts ([next/font](#)) — fallback to system-ui

VISUAL DIRECTION

Overall vibe: Cinematic, editorial, ultra-clean, luxury tech. Apple meets Sony flagship.

Seamless blending: The canvas background and page background must be pixel-perfect matches so product edges are invisible — the headphones appear to float in a unified void.

Color Palette

Role	Value
Primary background	#050505
Secondary background	#0A0A0C
Heading text	rgba(255, 255, 255, 0.9)
Body text	rgba(255, 255, 255, 0.6)
Primary accent	#0050FF (Sony blue)
Secondary accent	#00D6FF (electric cyan)

Radial glow (hero) `#050505 → #050815` (extremely subtle)

Gradients:

- Hero radial: `radial-gradient(ellipse at center, #050815 0%, #050505 70%)` — nearly invisible, purely atmospheric
- CTA/accent gradient: `linear-gradient(135deg, #0050FF, #00D6FF)` — applied to button borders, underlines, and key labels only

Typography

- Font: `Inter` (loaded via `next/font/google`)
- Headings: Bold, `tracking-tight`, large scale, near-white, editorial hierarchy
- Subheadings: Medium weight, slightly muted
- Body: 16–18px, `leading-relaxed`, `text-white/60`
- Optional heading treatment: subtle gradient fill from `#FFFFFF → #00D6FF` at the base of letterforms (CSS `background-clip: text`), used sparingly on 1–2 key headlines only

NAVBAR — APPLE-STYLE

Structure: Fixed, full-width, slim height (~44px), always on top.

Layout (left → center → right):

- Left: Product wordmark — `"WH-1000XM6"` in medium weight, clean sans-serif
- Center: Nav links — `Overview · Technology · Noise Cancelling · Specs · Buy`
- Right: CTA button — `"Experience WH-1000XM6"` with `#0050FF → #00D6FF` gradient border, subtle glow on hover

Styling:

- Background: `rgba(5, 5, 5, 0.0)` at top → `rgba(5, 5, 5, 0.80)` with `backdrop-blur-md` after 60px scroll
- Transition: `opacity` and `background` eased over 300ms
- Link hover: `opacity` shift + 1px underline in accent color, no heavy decoration
- Use `useScroll` + Framer Motion `useTransform` to drive the nav opacity/blur

CORE INTERACTION — SCROLL-LINKED IMAGE SEQUENCE

Canvas Setup

- Full-viewport sticky canvas (`position: sticky; top: 0; height: 100vh; width: 100%`)
- Contained inside a scroll driver element with height `~400vh`
- Canvas content is centered and scaled with `object-fit: contain` logic (preserve aspect ratio, no cropping)
- Canvas background: exactly `#050505` — matches page background for seamless floating effect

Image Sequence

- **Total frames:** 120
- **Source:** Loaded from the project's image sequence folder at build/runtime
- **Preloading:** All frames preloaded into an array of `Image` objects on mount (`useEffect`)
- **Frame selection:** `Math.round(scrollProgress * (totalFrames - 1))` — smooth, no flicker
- **Rendering:** `requestAnimationFrame`-synced canvas draw on each scroll tick
- **Quality:** Frames should be high-resolution, cinematic, with dramatic rim lighting, deep blacks, and controlled reflections against a pure `#050505` background

Sequence Arc

Scroll %	Visual State
0–15%	Fully assembled hero shot, cinematic three-quarter angle, rim-lit silhouette
15–40%	Soft disassembly begins — ear cups, headband, cushions drift apart; internal structure emerges
40–65%	Exploded view peaks — microphones, drivers, PCBs, acoustic chambers fully separated and floating
65–85%	Sound components highlighted — drivers, coils, magnets, acoustic chambers

Graceful reassembly — all components glide back into final hero pose

85–100
%

SCROLL STORYTELLING — COPY BEATS

All copy overlays float above the canvas via absolute positioning. They fade/slide in and out using Framer Motion, `useTransform` tied to scroll progress. Never block the product.

Beat 1 — Hero (0–15%)

Position: Centre

[product]

Silence, perfected.

Flagship wireless noise cancelling, re-engineered for a world that never stops.

- Headline: Large, bold, `tracking-tight`
- Subheadline: Medium, `text-white/70`
- Supporting line: Small, `text-white/50`

Beat 2 — Engineering Reveal (15–40%)

Position: Left-aligned, slides in from left

Precision-engineered for silence.

Custom drivers, sealed acoustic chambers, and optimized airflow
deliver studio-grade clarity — hour after hour.

Beat 3 — Noise Cancelling (40–65%)

Position: Right-aligned, slides in from the right

Adaptive noise cancelling, redefined.

- Multi-microphone array listens in every direction.
- Real-time analysis adjusts to your environment.
- Planes, trains, and crowds fade away. Your music stays pure.

Beat 4 — Sound & Upscaling (65–85%)

Position: Left-aligned or centred (based on composition breathing room)

Immersive, lifelike sound.

High-performance drivers unlock detail, depth, and texture in every track.
AI-enhanced upscaling restores presence and clarity to compressed audio —
so every note feels alive.

Beat 5 — Reassembly & CTA (85–100%)

Position: Center

Hear everything. Feel nothing else.

WH-1000XM6. Designed for focus, crafted for comfort.

[Experience PRODUCT] See full specs →

Engineered for airports, offices, and everything in between.

- Primary CTA: gradient-bordered button (#0050FF → #00D6FF), soft glow on hover
- Secondary: plain text link, text-white/60
- Micro-copy: text-white/40, small, centered beneath CTAs

COPY ANIMATION LOGIC

Each copy block is driven by a useTransform tied to scrollYProgress:

Beat	Enters	Fully Visible	Exits
Hero	0%	5–12%	18%
Engineering	15%	22–35%	42%
Noise Cancelling	40%	47–60%	67%
Sound	65%	70–80%	87%

CTA 84% 90–100% —

Animation pattern per block:

- `opacity`: [0, 1, 1, 0]
 - `y` (translateY): [20px, 0px, 0px, -20px] (subtle lift-in, lift-out)
 - Easing: `easeOut` on enter, `easeIn` on exit
-

SECTIONS BELOW THE CANVAS SEQUENCE

After the sticky scroll section, add three full-width sections that continue the story:

1. Feature Grid

Three-column card layout. Each card: icon (SVG, minimal), short headline, 2-line description. Use #0A0A0C card background, #0050FF-tinted top border per card.

Suggested cards:

- **30-Hour Battery** — "All-day listening, even with noise cancelling active."
- **Multipoint Connect** — "Two devices, one seamless experience."
- **Speak-to-Chat** — "Your music pauses the moment you start talking."

2. Specs Strip

Minimal horizontal or 2-column table. Dark background, `text-white/50` labels, `text-white/90` values. Specs to include: Driver size, Frequency response, Battery life, Weight, Connectivity, Codec support, Colors.

3. Final CTA Section

Full-width, centered. Minimal. Large headline, one button, clean.

Ready to hear the difference?

[Buy WH-1000XM6] US\$399

Subtle radial glow behind the headline. Button uses full gradient fill.

FOOTER

Minimal. One line: copyright + nav links (Privacy · Terms · Contact). `text-white/30`, `text-xs`. No decoration.

PERFORMANCE & CODE QUALITY REQUIREMENTS

- Canvas frames preloaded before first interaction (`Promise.all` on image load)
 - Loading state: minimal centered progress indicator ("`Loading...`" or a slim progress bar) shown until all frames are ready
 - `useRef` for canvas element, `useEffect` for image preloading
 - `useScroll({ target: sectionRef })` scoped to the sticky section container, not the window
 - `requestAnimationFrame` used for canvas draw scheduling; never draw on every scroll event directly
 - No layout shift: canvas dimensions set explicitly on mount
 - Images decoded with `img.decode()` before adding to sequence array
 - All Framer Motion components use `will-change: opacity, transform` (applied automatically by Framer)
 - Lazy load everything below the fold (next/image with `loading="lazy"` for static assets)
 - Zero third-party dependencies beyond Next.js, Tailwind, and Framer Motion
-

COMPONENT STRUCTURE

```

app/
  page.tsx      ← Root page assembles all sections
  layout.tsx    ← Font loading, metadata, base styles
components/
  Navbar.tsx    ← Sticky glassmorphism nav
  HeroSequence.tsx ← Sticky canvas + scroll driver + copy overlays
  CanvasPlayer.tsx ← Canvas rendering logic, frame management
  CopyOverlay.tsx ← Scroll-driven text beat component
  FeatureGrid.tsx ← Three-card feature section
  SpecsTable.tsx  ← Specs strip
  
```

FinalCTA.tsx	← Bottom purchase section
Footer.tsx	← Minimal footer

QUALITY BAR

Every decision should pass this test: *"Would this ship on Apple.com or Sony's global flagship product page?"*

- No decorative noise — every element earns its place
- No layout clutter — generous negative space throughout
- Scroll must feel buttery, hardware-accelerated, never janky
- Typography hierarchy must be immediately clear at a glance
- Product must always feel like the hero — UI chrome never competes with it
